

## Consent to SARS-COVID-19 Serial Testing

Mountain Park Urgent Care and Walk-In Clinic  
90 E. Main Street, Suite 2 / Sylva, NC 28779

The proposed COVID-19 testing is a mid-turbinate nasal swab (does not go in the nose as far as the nasopharyngeal swab) for the diagnosis of SARS-COVID-19.

The test will be performed once a week during the school day by trained medical personnel.

Results will be available on the patient portal (if email is provided) or negative results will go home with your child from school when available. All positive tests will be called as soon as the test results are available, and questions answered regarding CDC recommendations for staying home after a positive COVID-19 test. All test results will be reported to your county health department.

Testing is offered to all students and staff for the monitoring of asymptomatic and symptomatic students and staff to reduce the spread and/or contain any potential outbreak of COVID-19. Timely diagnosis of a positive case can reduce the number of cases in the school and keep more children, staff and families safe.

This is NOT a mandatory test however, the more participants, the more information the school will have to continue to reduce your risk of infection.

\*\*\*I authorize that a test sample be taken for COVID-19 as described above as ordered by a provider at Mountain Park Urgent Care and carried out by a trained medical professional on a weekly basis from 8/31/2020 through 12/18/2020. I do hereby consent to any healthcare provider examining or testing my minor child to use or disclose protected health information for reporting purposes only to the school and county health department. This consent is for COVID-19 nasal swab testing starting the week of 09/14/2020 and ending 12/18/2020.\*\*\*

## Mid Turbinate nasal swab procedure for COVID-19 testing

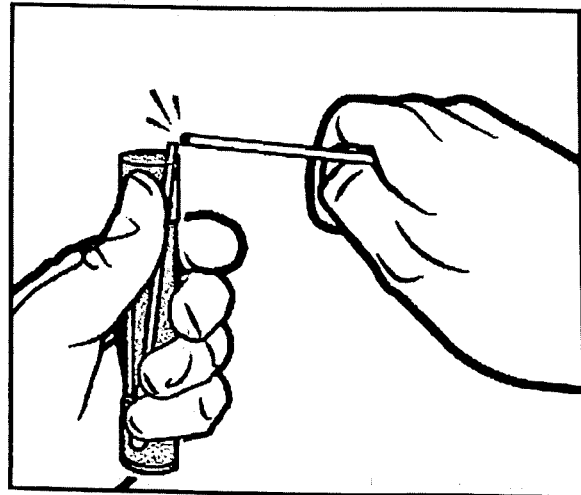

Tilt patient head back 70°.

Rotate the swab several times against nasal wall and then hold in place for 5 seconds.

While gently rotating the swab, insert mid-turbinate swab into the nostril to the stopper (until resistance is met at turbinates).

Place swab in UTM and break the shaft at the breakpoint. Screw on cap.
